Fluid and Thermal Systems

## Answers to Lab 5

## Example 1: (Exercises with interpolation)

Sometimes property data does not fall on the points given in the table. Under these conditions, we must interpolate between the available data points on the table to find the necessary information. Typically this is done using linear interpolation. This means that the missing data between the available points can be estimated by assuming that the functional relationship is a straight line.

|  | Superheated water vapor, $v=v(P, T)$ |  |  |
| :---: | :---: | :---: | :---: |
| Temperature | Pressure |  |  |
|  | 1.5 bars | 3.0 bars |  |
| $200^{\circ} \mathrm{C}$ | $1.444 \mathrm{~m}^{3} / \mathrm{kg}$ | $0.716 \mathrm{~m}^{3} / \mathrm{kg}$ |  |
| $240^{\circ} \mathrm{C}$ | $1.570 \mathrm{~m}^{3} / \mathrm{kg}$ | $0.781 \mathrm{~m}^{3} / \mathrm{kg}$ |  |

a) $P=1.5$ bars, $T=215{ }^{\circ} \mathrm{C}$ (linear) [Answer: $1.491 \mathrm{~m}^{3} / \mathrm{kg}$ ] $\quad v=\underline{1.491 \mathrm{~m}^{3} / \mathrm{kg}}$

- Using linear interpolation between the given data points at $P=1.5$ bars,

$$
\frac{v-1.444}{215-200}=\frac{1.570-1.444}{240-200} \quad \Rightarrow \quad v=1.491 \mathrm{~m}^{3} / \mathrm{kg}
$$

b) $P=2.0$ bars, $T=200^{\circ} \mathrm{C}$ (linear) [Answer: $1.201 \mathrm{~m}^{3} / \mathrm{kg}$ ] $\quad v=\underline{1.201 \mathrm{~m}^{3} / \mathrm{kg}}$

- Using linear interpolation between the given data points at $T=200^{\circ} \mathrm{C}$,

$$
\frac{v-1.444}{2-1.5}=\frac{0.716-1.444}{3-1.5} \quad \Rightarrow \quad v=1.201 \mathrm{~m}^{3} / \mathrm{kg}
$$

c) $P=2.0$ bars, $T=215^{\circ} \mathrm{C}$ (bi-linear) [Answer: $1.241 \mathrm{~m}^{3} / \mathrm{kg}$ ] $\quad v=\underline{\mathbf{1 . 2 4 1}} \mathrm{m}^{3} / \mathrm{kg}$

- Neither the given pressure nor the given temperature are the tabulated values, a bi-linear interpolation procedure (in both the pressure and temperature axes) is necessary to obtain the desired value.
- Firstly, perform linear interpolation between the given data points at $P=1.5$ bars, $T=215^{\circ} \mathrm{C}$,

$$
\frac{v_{1.5}-1.444}{215-200}=\frac{1.570-1.444}{240-200} \quad \Rightarrow \quad v_{1.5}=1.491 \mathrm{~m}^{3} / \mathrm{kg}
$$

- Secondly, perform linear interpolation between the given data points at $P=3.0$ bars, $T=215^{\circ} \mathrm{C}$,

$$
\frac{v_{3.0}-0.716}{215-200}=\frac{0.781-0.716}{240-200} \Rightarrow \quad v_{3.0}=0.740 \mathrm{~m}^{3} / \mathrm{kg}
$$

- Finally, perform linear interpolation between the given data points at $P=1.5$ bars, $T=215^{\circ} \mathrm{C}$ and $P=3.0$ bars, $T=215^{\circ} \mathrm{C}$,

$$
\frac{\boldsymbol{v}-\boldsymbol{v}_{1.5}}{\boldsymbol{v}_{3.0}-\boldsymbol{v}_{1.5}}=\frac{2.0-1.5}{3.0-1.5}
$$

$$
\Rightarrow \quad v=1.241 \mathrm{~m}^{3} / \mathrm{kg}
$$

d) $P=1.5$ bars, $v=1.500 \mathrm{~m}^{3} / \mathrm{kg}$ (linear) [Answer: $218{ }^{\circ} \mathrm{C}$ ] $T=\underline{218}{ }^{\circ} \mathrm{C}$

- Using linear interpolation between the given data points at $P=1.5$ bars,

$$
\frac{1.5-1.444}{\boldsymbol{T}-200}=\frac{1.570-1.444}{240-200} \Rightarrow \quad \boldsymbol{T}=218^{\circ} \mathrm{C}
$$

Example 2: (Exercises on property table look-up for water)
a) Provide the information requested (unshaded boxes) in the following table for WATER. Use the following abbreviations when specifying the phases:

$$
\begin{aligned}
\mathrm{CL} & =\text { compressed (subcooled) liquid } \\
\text { SL } & =\text { saturated liquid } \\
\text { SM } & =\text { saturated mixture } \\
\text { SV } & =\text { saturated vapor } \\
\text { SHV } & =\text { superheated vapor }
\end{aligned}
$$

Use "NA" for items that are not applicable and "INSUF" for insufficient information at a particular state.

| State | Phase | Pressure, <br> $P[\mathrm{kPa}]$ | Temper- <br> ature <br> $T\left[{ }^{\circ} \mathrm{C}\right]$ | Quality, $x$ | Specific <br> Volume, $v$ <br> $\left[\mathrm{~m}^{3} / \mathrm{kg}\right]$ | Specific <br> Internal <br> Energy, $u$ <br> $[\mathrm{~kJ} / \mathrm{kg}]$ | Specific <br> Enthalpy, <br> $h[\mathrm{~kJ} / \mathrm{kg}]$ | Specific <br> Entropy, $s$ <br> $[\mathrm{~kJ} /(\mathrm{kg}-\mathrm{K}]$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | SHV | 500 | 350 | NA | 0.5701 |  | 3167.7 |  |
| 2 | SL | 500 | 151.86 |  | 0.00109 |  | 640.23 | 1.8607 |
| 3 | SM | 500 | 151.86 | 0.1875 | 0.07118 | 1000 |  |  |
| 4 | SV | 500 | 151.86 | 1.0 |  | 2561.2 | 2748.7 |  |
| 5 | SM | 101.33 | 100 | 0.30 | 0.5026 |  |  | 3.1213 |
| 6 | SHV | 91.17 | 100 | NA | 2.0 |  | 2677.3 |  |
| 7 | SM | 101.33 | 100 | 0.7760 | 1.2984 |  |  | 6.0 |
| 8 | SL | 101.33 | 100 | 0.0 | 0.00104 | 418.94 | 419.04 | 1.3069 |
| 9 | SL | 5000 | 263.99 | 0.0 | 0.00129 | 1147.81 | 1154.23 | 2.9202 |
| 10 | CL | 5000 | 100 | NA | 0.00104 | 417.52 | 422.72 | 1.3030 |

b) States 8 and 9 are approximations of state 10 . Which approximation is more accurate? Plot these three states on the $P-v$ and $T-v$ diagrams and explain your choice.

- State 8 is a more accurate approximation of State 10. In the compressed liquid region, the properties are less sensitive to changes in pressure than those in temperature. Hence, the compressed liquid properties can be approximated by:

$$
\begin{gathered}
u(P, T) \cong u_{f}(T) \\
v(P, T) \cong v_{f}(T) \\
s(P, T) \cong s_{f}(T) \\
h(P, T) \cong h_{f}(T)+\left[P-P_{\text {sat }}(T)\right] v_{f}(T)
\end{gathered}
$$

Example 3: (More exercise with property lookup for Refrigerant 134a)
Provide the information requested in the following table for Refrigerant 134a. Use the following abbreviations when specifying the phases:

$$
\begin{aligned}
\text { CL } & =\text { compressed (subcooled) liquid } \\
\text { SL } & =\text { saturated liquid } \\
\text { SM } & =\text { saturated mixture } \\
\text { SV } & =\text { saturated vapor } \\
\text { SHV } & =\text { superheated vapor } \\
\text { NA } & =\text { not applicable } \\
\text { INSUF } & =\text { insufficient information }
\end{aligned}
$$

| State | Phase | Pressure, $P(\mathrm{kPa})$ | $\begin{gathered} \text { Temper- } \\ \text { ature } \\ T\left({ }^{\circ} \mathrm{C}\right) \end{gathered}$ | Specific Volume, ( $\mathrm{m}^{3} / \mathrm{kg}$ ) | Specific <br> Internal <br> Energy, u <br> (kJ/kg) | Specific Enthalpy, $h(\mathrm{~kJ} / \mathrm{kg})$ | Specific Entropy, s (kJ/kg-K) | Quality, $x$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | CL | 240 | -12 | . 000750 |  |  | 0.1388 | NA |
| 2 | SHV | 240 | 20 | . 09339 |  | 266.85 |  | NA |
| 3 | SL | 240 | -5.37 |  | 42.77 |  | 0.1710 | 0.0 |
| 4 | SM | 240 | -5.37 |  | 139.26 | 150 |  | 0.5322 |
| 5 | SV | 240 | -5.37 | 0.0834 |  | 244.09 |  |  |
| 6 | SM | 770.06 | 30 | 0.01111 |  | 160.29 |  | 0.4 |
| 7 | SM | 770.06 | 30 | 0.0188 |  |  | 0.7367 | 0.6999 |
| 8 | SL | 770.06 | 30 |  | 90.84 |  | 0.3396 | 0.0 |
| 9 | SV | 770.06 | 30 | 0.0265 | 243.1 | 263.5 | 0.9070 | 1.0 |
| 10 | CL | 1400 | 30 |  | 90.84 | 92.02 |  | NA |
| 11 | SHV | 1400 | 60 | 0.01495 |  | 283.1 |  | NA |
