

```
class Point:
    def __init__(self, x, y):
        self.x = x
        self.y = y
```

```
class Line:
    def __init__(self, start, end):
        self.start = start
        self.end = end
        # Note: no clone
```

```
p1 = Point(1, 2)
p2 = Point(3, 4)
```

```
line = Line(p1, p2)
```

In your opinion, SHOULD the following statement have ANY affect on the Line? Your answer to that question determines whether or not the Line class should CLONE its two Point objects.

```
p1.x = 100
```
