

Chapter 5 – Decisions

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Chapter Goals

- To be able to implement decisions using `if` statements
 - To understand how to group statements into blocks
 - To learn how to compare integers, floating-point numbers, strings, and objects
 - To recognize the correct ordering of decisions in multiple branches
 - To program conditions using Boolean operators and variables
- T** To understand the importance of test coverage

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

The `if` Statement

- The `if` statement lets a program carry out different actions depending on a condition

```
if (amount <= balance)
    balance = balance - amount;
```

Figure 1
Flowchart for an `if` Statement

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

The `if/else` Statement

```
if (amount <= balance)
    balance = balance - amount;
else
    balance = balance - OVERDRAFT_PENALTY
```

Figure 2
Flowchart for an `if/else` Statement

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Statement Types

- Simple statement:

```
balance = balance - amount;
```

- Compound statement:

```
if (balance >= amount) balance = balance - amount;
```

Also loop statements — Chapter 6

- Block statement:

```
{
    double newBalance = balance - amount;
    balance = newBalance;
}
```

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Syntax 5.1 The if Statement

Syntax

```
if (condition)
    statement1
else
    statement2
```

Example

```
if (amount <= balance)
    balance = balance - amount;
else
    System.out.println("Insufficient funds");
    balance = balance - OVERDRAFT_PENALTY;
```

A condition that is true or false.
Often uses relational operators: == != < <= > >=

Don't put a semicolon here!

Braces are not required if the body contains a single statement.

If the condition is true, the statement(s) in this branch are executed in sequence; if the condition is false, they are skipped.

Quit the else branch if there is nothing to do.

If condition is false, the statement(s) in this branch are executed in sequence; if the condition is true, they are skipped.

Living up braces is a good idea.

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Self Check 5.1

Why did we use the condition `amount <= balance` and not `amount < balance` in the example for the `if/else` statement?

Answer: If the withdrawal amount equals the balance, the result should be a zero balance and no penalty.

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Self Check 5.2

What is logically wrong with the statement

```
if (amount <= balance)
    newBalance = balance - amount;
    balance = newBalance;
```

and how do you fix it?

Answer: Only the first assignment statement is part of the `if` statement. Use braces to group both assignment statements into a block statement.

Comparing Values: Relational Operators

- Relational operators compare values

Java	Math Notation	Description
>	>	Greater than
>=	≥	Greater than or equal
<	<	Less than
<=	≤	Less than or equal
==	=	Equal
!=	≠	Not equal

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Values: Relational Operators

- The == denotes equality testing:

```
a = 5; // Assign 5 to a
if (a == 5) ... // Test whether a equals 5
```

- Relational operators have lower precedence than arithmetic operators:

```
amount + fee <= balance
```

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Floating-Point Numbers

- Consider this code:

```
double r = Math.sqrt(2);
double d = r * r - 2;
if (d == 0)
    System.out.println("sqrt(2)squared minus 2 is 0");
else
    System.out.println("sqrt(2)squared minus 2 is not 0 but "
        + d);
```

- It prints:

```
sqrt(2)squared minus 2 is not 0 but 4.440892098500626E-16
```

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Floating-Point Numbers

- To avoid roundoff errors, don't use == to compare floating-point numbers

- To compare floating-point numbers test whether they are *close enough*: $|x - y| \leq \epsilon$

```
final double EPSILON = 1E-14;
if (Math.abs(x - y) <= EPSILON)
    // x is approximately equal to y
```

- ϵ is a small number such as 10^{-14}

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Strings

- To test whether two strings are equal to each other, use `equals` method:

```
if (string1.equals(string2)) . . .
```

- Don't use `==` for strings!

```
if (string1 == string2) // Not useful
```

- `==` tests identity, `equals` tests equal contents

- Case insensitive test:

```
if (string1.equalsIgnoreCase(string2))
```

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Strings

- `string1.compareTo(string2) < 0` means:
string1 comes before string2 in the dictionary
- `string1.compareTo(string2) > 0` means:
string1 comes after string2
- `string1.compareTo(string2) == 0` means:
string1 equals string2
- "car" comes before "cargo"
- All uppercase letters come before lowercase:
"Hello" comes before "car"

Big Java by Cay Horstmann

Lexicographic Comparison

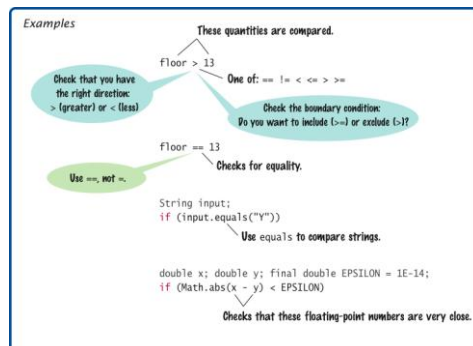

Figure 3
Lexicographic Comparison

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Syntax 5.2 Comparisons

Big Java by Cay Horstmann
Copyright © 2009 by John Wiley & Sons. All rights reserved.

Comparing Objects

- `==` tests for identity, `equals` for identical content
- ```
Rectangle box1 = new Rectangle(5, 10, 20, 30);
Rectangle box2 = box1;
Rectangle box3 = new Rectangle(5, 10, 20, 30);
```
- `box1 != box3`, but `box1.equals(box3)`
- `box1 == box2`
- **Caveat:** `equals` must be defined for the class

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Object Comparison

Figure 4  
Comparing Object References

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Testing for null

- `null` reference refers to no object:  

```
String middleInitial = null; // Not set
if (...)
 middleInitial = middleName.substring(0, 1);
```
- Can be used in tests:  

```
if (middleInitial == null)
 System.out.println(firstName + " " + lastName);
else
 System.out.println(firstName + " " + middleInitial +
 ". " + lastName);
```
- Use `==`, not `equals`, to test for `null`
- `null` is not the same as the empty string `""`

Big Java by Cay Horstmann

## Relational Operator Examples

| Table 1 Relational Operator Examples                |              |                                                                                                                                                     |  |
|-----------------------------------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--|
| Expression                                          | Value        | Comment                                                                                                                                             |  |
| <code>3 &lt; 4</code>                               | true         | 3 is less than 4; <code>&lt;</code> tests for "less than or equal".                                                                                 |  |
| <code>3 &lt;= 4</code>                              | <b>Error</b> | The "less than or equal" operator is <code>&lt;=</code> , not <code>&lt;=</code> , with the "less than" symbol first.                               |  |
| <code>3 &gt; 4</code>                               | false        | <code>&gt;</code> is the opposite of <code>&lt;</code> .                                                                                            |  |
| <code>4 &lt; 4</code>                               | false        | The left-hand side must be strictly smaller than the right-hand side.                                                                               |  |
| <code>4 &lt;= 4</code>                              | true         | Both sides are equal. <code>&lt;=</code> tests for "less than or equal".                                                                            |  |
| <code>3 == 5 - 2</code>                             | true         | <code>==</code> tests for equality.                                                                                                                 |  |
| <code>3 != 5 - 1</code>                             | true         | <code>!=</code> tests for inequality. It is true that 3 is not 5 - 1.                                                                               |  |
| <code>3 == 6 / 2</code>                             | <b>Error</b> | Use <code>==</code> to test for equality.                                                                                                           |  |
| <code>1.0 / 3.0 == 0.33333333</code>                | false        | Although the values are very close to one another, they are not exactly equal. See Common Error 4.3.                                                |  |
| <code>"10" &gt; 5</code>                            | <b>Error</b> | You cannot compare a string to a number.                                                                                                            |  |
| <code>"Tomato".substring(0, 3).equals("Tom")</code> | true         | Always use the <code>equals</code> method to check whether two strings have the same contents.                                                      |  |
| <code>"Tomato".substring(0, 3) == ("Tom")</code>    | false        | Never use <code>==</code> to compare strings; it only checks whether the strings are stored in the same location. See Common Error 5.2 on page 182. |  |
| <code>"Tom".equalsIgnoreCase("TOM")</code>          | true         | Use the <code>equalsIgnoreCase</code> method if you don't want to distinguish between uppercase and lowercase letters.                              |  |

Big Java by Cay Horstmann

### Self Check 5.3

What is the value of `s.length()` if `s` is

- the empty string ""?
- the string " " containing a space?
- null?

**Answer:** (a) 0; (b) 1; (c) an exception occurs.

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Self Check 5.4

Which of the following comparisons are syntactically incorrect? Which of them are syntactically correct, but logically questionable?

```
String a = "1";
String b = "one";
double x = 1;
double y = 3 * (1.0 / 3);
a. a == "1"
b. a == null
c. a.equals("")
d. a == b
e. a == x
f. x == y
g. x - y == null
h. x.equals(y)
```

**Answer:** Syntactically incorrect: e, g, h. Logically questionable: a, d, f.

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Multiple Alternatives: Sequences of Comparisons

```
• if (condition1)
 statement1;
 else if (condition2)
 statement2;
 ...
 else
 statement4;
```

- The first matching condition is executed

- Order matters:

```
if (richter >= 0) // always passes
 r = "Generally not felt by people";
else if (richter >= 3.5) // not tested
 r = "Felt by many people, no destruction";
...

```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Multiple Alternatives: Sequences of Comparisons

- Don't omit else:

```
if (richter >= 8.0)
 r = "Most structures fall";
if (richter >= 7.0) // omitted else--ERROR
 r = "Many buildings destroyed";

```

Big Java by Cay Horstmann

Copyright © 2009 by John Wiley & Sons. All rights reserved.

## ch05/quake/Earthquake.java (cont.)

```

17 /**
18 * Gets a description of the effect of the earthquake.
19 * @return the description of the effect
20 */
21 public String getDescription()
22 {
23 String r;
24 if (richter >= 8.0)
25 r = "Most structures fall";
26 else if (richter >= 7.0)
27 r = "Many buildings destroyed";
28 else if (richter >= 6.0)
29 r = "Many buildings considerably damaged, some collapse";
30 else if (richter >= 4.5)
31 r = "Damage to poorly constructed buildings";
32 else if (richter >= 3.5)
33 r = "Felt by many people, no destruction";
34 else if (richter >= 0)
35 r = "Generally not felt by people";
36 else
37 r = "Negative numbers are not valid";
38 return r;
39 }
40 }

```

Big Java by Cay Horstmann

## ch05/quake/EarthquakeRunner.java

```

1 import java.util.Scanner;
2
3 /**
4 * This program prints a description of an earthquake of a given magnitude.
5 */
6 public class EarthquakeRunner
7 {
8 public static void main(String[] args)
9 {
10 Scanner in = new Scanner(System.in);
11
12 System.out.print("Enter a magnitude on the Richter scale: ");
13 double magnitude = in.nextDouble();
14 Earthquake quake = new Earthquake(magnitude);
15 System.out.println(quake.getDescription());
16 }
17 }

```

## Program Run:

```

Enter a magnitude on the Richter scale: 7.1
Many buildings destroyed

```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Multiple Alternatives: Nested Branches

- Branch inside another branch:

```

if (condition1)
{
 if (condition1A)
 statement1A;
 else
 statement1B;
}
else
 statement2;

```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Tax Schedule

| If your filing status is Single |            | If your filing status is Married |            |
|---------------------------------|------------|----------------------------------|------------|
| Tax Bracket                     | Percentage | Tax Bracket                      | Percentage |
| \$0 ... \$32,000                | 10%        | 0 ... \$64,000                   | 10%        |
| Amount over \$32,000            | 25%        | Amount over \$64,000             | 25%        |

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Nested Branches

- Compute taxes due, given filing status and income figure:
  1. *branch on the filing status*
  2. *for each filing status, branch on income level*
- The two-level decision process is reflected in two levels of `if` statements
- We say that the income test is *nested* inside the test for filing status

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Nested Branches

### Self Check 5.5

The `if/else/else` statement for the earthquake strength first tested for higher values, then descended to lower values. Can you reverse that order?

**Answer:** Yes, if you also reverse the comparisons:

```
if (richter < 3.5)
 r = "Generally not felt by people";
else if (richter < 4.5)
 r = "Felt by many people, no destruction";
else if (richter < 6.0)
 r = "Damage to poorly constructed buildings";
...
```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Self Check 5.6

Some people object to higher tax rates for higher incomes, claiming that you might end up with less money after taxes when you get a raise for working hard. What is the flaw in this argument?

**Answer:** The higher tax rate is only applied on the income in the higher bracket. Suppose you are single and make \$31,900. Should you try to get a \$200 raise? Absolutely: you get to keep 90 percent of the first \$100 and 75 percent of the next \$100.

Big Java by Cay Horstmann

### Using Boolean Expressions: The `boolean` Type

- George Boole (1815-1864): pioneer in the study of logic
- value of expression `amount < 1000` is `true` or `false`
- `boolean` type: one of these 2 truth values

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Using Boolean Expressions: Predicate Method

- A predicate method returns a `boolean` value:

```
public boolean isOverdrawn()
{
 return balance < 0;
}
```

- Use in conditions:

```
if (harrysChecking.isOverdrawn())
```

- Useful predicate methods in `Character` class:

```
isDigit
isLetter
isUpperCase
isLowerCase
```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Using Boolean Expressions: Predicate Method

- `if (Character.isUpperCase(ch)) ...`
- Useful predicate methods in `Scanner` class: `hasNextInt()` and `hasNextDouble()`:  

```
if (in.hasNextInt()) n = in.nextInt();
```

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

### Using Boolean Expressions: The Boolean Operators

- `&&` and
- `||` or
- `!` not
- `if (0 < amount && amount < 1000) ...`
- `if (input.equals("S") || input.equals("M")) ...`
- `if (!input.equals("S")) ...`

### Boolean Operators

| Expression                                             | Value                                                    | Comment                                                                                                                                             |
|--------------------------------------------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>0 &lt; 200 &amp;&amp; 200 &lt; 100</code>        | false                                                    | Only the first condition is true.                                                                                                                   |
| <code>0 &lt; 200    200 &lt; 100</code>                | true                                                     | The first condition is true.                                                                                                                        |
| <code>0 &lt; 200    100 &lt; 200</code>                | true                                                     | The    is not a test for "either-or". If both conditions are true, the result is true.                                                              |
| <code>0 &lt; 100 &lt; 200</code>                       | Syntax error                                             | <b>Error:</b> The expression <code>0 &lt; 100</code> is true, which cannot be compared against 200.                                                 |
| <code>0 &lt; x    x &lt; 100</code>                    | true                                                     | <b>Error:</b> This condition is always true. The programmer probably intended <code>0 &lt; x &amp;&amp; x &lt; 100</code> . (See Common Error 5.5). |
| <code>0 &lt; x &amp;&amp; x &lt; 100    x == -1</code> | <code>(0 &lt; x &amp;&amp; x &lt; 100)    x == -1</code> | The && operator binds more strongly than the    operator.                                                                                           |
| <code>!(0 &lt; 200)</code>                             | false                                                    | <code>0 &lt; 200</code> is true, therefore its negation is false.                                                                                   |
| <code>frozen == true</code>                            | frozen                                                   | There is no need to compare a Boolean variable with true.                                                                                           |
| <code>frozen == false</code>                           | !frozen                                                  | It is clearer to use ! than to compare with false.                                                                                                  |

## Truth Tables

| A     | B          | A && B |
|-------|------------|--------|
| true  | true       | true   |
| true  | false      | false  |
| false | <i>Any</i> | false  |

| A     | B          | A    B |
|-------|------------|--------|
| true  | <i>Any</i> | true   |
| false | true       | true   |
| false | false      | false  |

| A     | !A    |
|-------|-------|
| true  | false |
| false | true  |

## Using Boolean Variables

- `private boolean married;`

- **Set to truth value:**

```
married = input.equals("M");
```

- **Use in conditions:**

```
if (married) ... else ...
if (!married) ...
```

- Also called *flag*

- It is considered *gauche* to write a test such as

```
if (married == true) ... // Don't
```

- **Just use the simpler test**

```
if (married) ...
```

## Self Check 5.7

When does the statement

```
system.out.println (x > 0 || x < 0);
```

print `false`?

**Answer:** When `x` is zero.

## Self Check 5.8

Rewrite the following expression, avoiding the comparison with `false`:

```
if (character.isDigit(ch) == false) ...
```

**Answer:** `if (!Character.isDigit(ch)) ...`

## Code Coverage

---

- **Black-box testing:** Test functionality without consideration of internal structure of implementation
- **White-box testing:** Take internal structure into account when designing tests
- **Test coverage:** Measure of how many parts of a program have been tested
- Make sure that each part of your program is exercised at least once by one test case  
E.g., make sure to execute each branch in at least one test case

Big Java by Cay Horstmann

## Code Coverage

---

- Include boundary test cases: Legal values that lie at the boundary of the set of acceptable inputs
- Tip: Write first test cases before program is written completely → gives insight into what program should do

## Self Check 5.9

---

How many test cases do you need to cover all branches of the `getDescription` method of the `Earthquake` class?

**Answer:** 7.

Big Java by Cay Horstmann  
Copyright © 2009 by John Wiley & Sons. All rights reserved.

## Self Check 5.10

---

Give a boundary test case for the `EarthquakeRunner` program. What output do you expect?

**Answer:** An input of 0 should yield an output of "Generally not felt by people". (If the output is "Negative numbers are not allowed", there is an error in the program.)
