# Object Design

Part 1 of Many  
Also Class Diagrams

# Designing Classes

- Programs typically begin as abstract ideas
- These ideas form a set of requirements (i.e. what the user wants)
- We must take these requirements, and figure out an approach for our coding
- Usually the approach is not obvious
- So we propose designs, then iteratively refine them into something that might work (continued...)

- So we propose designs, then iteratively refine them into something that might work
  - Many bad ideas in the process
  - We don't want to go through the effort of implementing bad ideas in code
  - But we need a way to communicate/think concretely about these half-baked program approaches
- We need a diagram language!

# Tools of the Trade

- ▶ Class Diagrams (UML)
- ▶ UML – Unified Modeling Language
  - Language **un**specific
  - Has a lot of different diagrams it provides specifications for – but the class diagram language is the most widely used

# A little class diagram will get you a long way

ClassName
Field names
Method names

- 3 sections
- Not the final version of UML we will teach, but covers the main points

---

## Example

Team
teamAverage name students
addGrade(grade) getTeamAverage()

Student
grades name
addGrade(grade)

# Lines

## A has a B (field)

---

### Example

Note the star means several... usually a list or collection.

# Summary of UML Class Diagram Arrows

Inheritance  
(is-a)

Interface  
Implementation  
(is-a)

Association  
(has-a-field)

Dependency  
(depends-on)

Two-way Association

Two-Way Dependency

Cardinality

(one-to-one, one-to-many)

One-to-many is shown on left

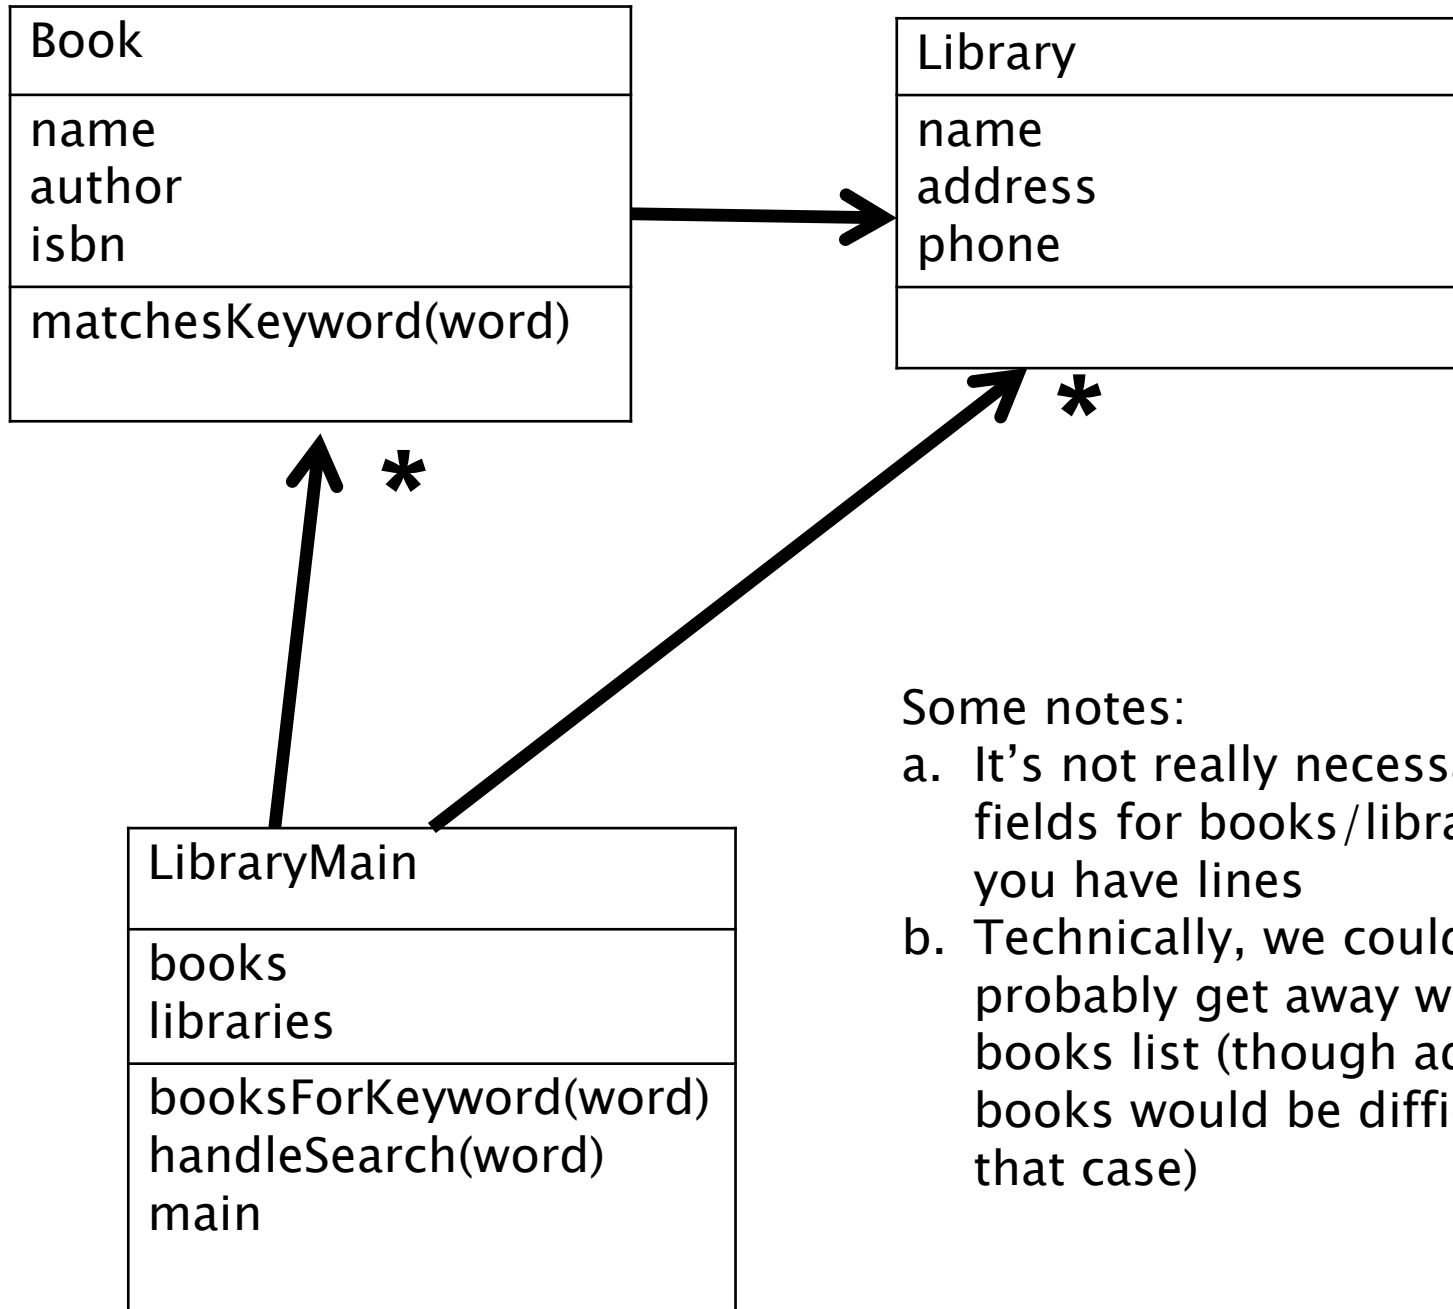

# A problem

We want to have a system that lets us search the catalogs of various nearby libraries for books.

We need to track the names, phone numbers, and addresses of the libraries. We need to track the titles, authors, and ISBN numbers of the books.

The main operation of the system is to search for a particular book by keyword (could be author, title, or ISBN), and get a listing of its info and the library that has it.

**In a group of 2–3, come up with a object design for this system and document it in UML (on a sheet of paper).**

Some notes:

- a. It's not really necessary to list fields for books/libraries *if* you have lines
- b. Technically, we could probably get away with just a books list (though adding new books would be difficult in that case)

# Main class

- ▶ Your design might have just included classes Book and Library – but remember all books and libraries must be stored somewhere
- ▶ In really small programs, you could just have them as local variables in a static main
- ▶ But for larger programs, it's more usual for the class with main to be a real class with fields (also aids testing)
- ▶ In our very simple designs, this class also deals with user input
- ▶ Also be sure your design shows where things start and how user commands are handled

LibraryMain
booksForKeyword(word) handleSearch(word) main

# 3 Things...

- ▶ The “things” of what you’re describing usually become the classes
  - The verbs usually become methods of the classes
- ▶ Avoid using plurals
  - We make an ArrayList of **Face** objects, not **Faces**.
- ▶ Make it work!
  - Go through it with some “use case” in mind and make sure that when this object is created, you can accomplish that case. Otherwise, **redesign** that design until it “works!!!”

# Good Classes Typically

- ▶ Come from **nouns** in the problem description
- ▶ May...
  - Represent **single concepts**
    - **Circle, Investment**
  - Represent **visual elements** of the project
    - **FacesComponent, UpdateButton**
  - Be **abstractions of real-life entities**
    - **BankAccount, TicTacToeBoard**

# A problem

A factory sells a small number of unique products. Each product has an id code, a description, price and quantity (the amount currently available at the factory). When a customer places an order, they buy a specific number of each product. The order needs to be stored in the system for future reference, with the customer's name and address.

At some point, the order should ship to the customer, and that date should also be recorded.

The main operation of the system is to add a new order and mark an order as shipped.

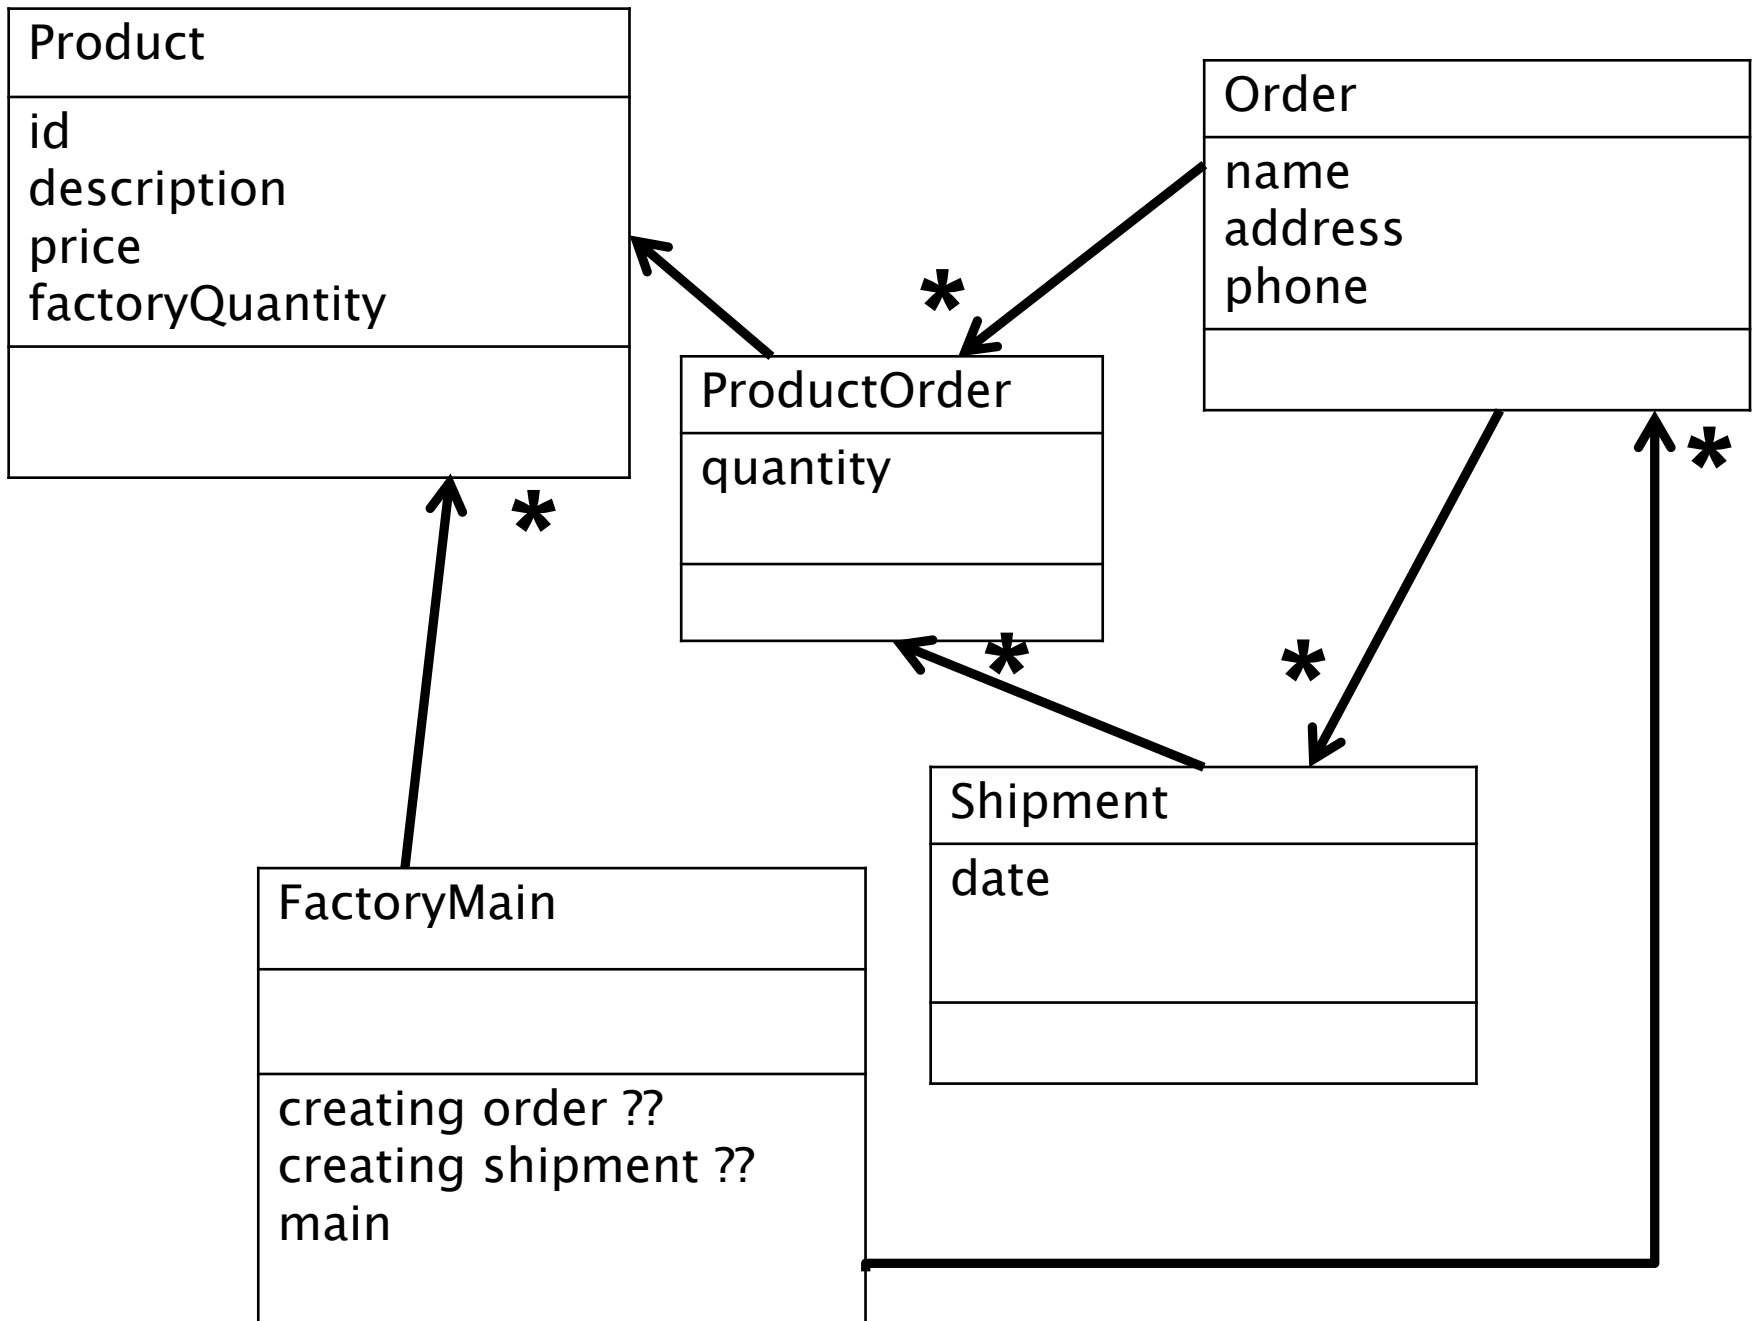

**In a group of 2–3, make with an object design for this system and document it in UML (on paper).**

# A problem –revised

Now orders can be partially shipped – i.e. a single order might take several shipments to complete.

The main operation of the system is to add a new order and enter shipments for orders.

**In a group of 2–3, revise your design to accommodate this new issue.**

# OrderTaker – Work with your groups of 3/4

- ▶ Decide what classes ought to be in the system and what methods/fields those classes should have (your design should have at least 2 classes)
- ▶ Don't forget one class needs to have a main method
- ▶ Make sure your design works!
- ▶ Write down your answers on a piece of paper with all of your team's names on it – this will be your quiz for today
- ▶ Call me over when you think you're done – then you'll implement it

# Advanced: Blackjack

- ▶ Decide what classes ought to be in the system and what methods/fields those classes should have (your design should have at least 3 classes)
- ▶ Don't forget one class needs to have a main method
- ▶ Make sure your design works!
- ▶ Write down your answers on a piece of paper with all of your team's names on it
- ▶ Call me over when you think you're done
