### Example

A pump is used to pump water from a low pressure,  $p_1$ , to a high pressure,  $p_2$ . The temperatures at the inlet and exit are  $T_1$  and  $T_2$ , respectively. The pump operates adiabatically and at steady state with a mass flow rate of  $\dot{m}$ . Show that the minimum power input to the pump corresponds to *isothermal* flow; i.e.,  $T_2 = T_1$ . (Hint: model water as an incompressible substance.)

---

### Example

A rigid, insulated (and therefore...) tank with a total volume of  $2 \text{ m}^3$  contains air at  $25^\circ\text{C}$  and  $100 \text{ kPa}$ . Initially the air occupies  $1 \text{ m}^3$  to one side of a thin membrane. A magic fairy then pokes a pinhole in the membrane allowing the air to eventually fill the whole tank. ( $c_v = 0.713 \text{ kJ/kg-K}$ ,  $c_p = 1.000 \text{ kJ/kg-K}$ ,  $R_{air} = 0.287 \text{ kJ/kg-K}$ )

- (a) Find the specific volume of the air (in  $\text{m}^3/\text{kg}$ ) in its initial state.
- (b) Find the final specific volume of the air.
- (c) Find the *entropy generated* (in  $\text{kJ/K}$ ) due to the expansion.
- (d) The magic fairy then lets all the air flow back through the pinhole to the right hand chamber. Calculate the *entropy generated* (in  $\text{kJ/K}$ ) for this process. Comment on the possibility of this process. Comment on the existence of fairies.
