## INSTRUCTIONS

- Closed book/notes exam. (Unit conversion page provided)
- Help sheet allowed. (8-1/2 x 11" sheet of paper, one side)
- Laptops may be used; however, no pre-prepared worksheets or files may be used.
- Ceci n'est pas un examen. Ceci n'est pas un test.

1) Show all work for complete credit.

- Start all problems at the ANALYSIS stage, but clearly label any information you use for your solution.
- Problems involving conservation principles MUST CLEARLY IDENTIFY THE SYSTEM IN A SEPARATE DRAWING and show a clear, logical progression from the basic principle.
- Don't expect us to read your mind as to how or why you did something in the solution. Clearly indicate how your arrived at your answer.
- Always crunch numbers last on an exam. The final numerical answer is worth the least amount of points. (Especially if all I would have to do is plug in the numbers into a well-documented solution.)

2) Useful Rule of Thumb (Heuristic): (100 point exam)/(50 min) $=2$ points/minute. That means a 10 point problem is not worth more than 5 minutes of your time (at least the first time around).
3) Please remain seated until the end of class or everyone finishes. (Raise your hand and I'll pick up your exam if you have other work you need or want to do.)

| USEFUL INFORMATION | SI | USCS | Molar Mass |  |
| :---: | :---: | :---: | :---: | :---: |
| Ideal Gas Constant: $R_{\mathrm{u}}$ | $=8.314 \mathrm{~kJ} /(\mathrm{kmol}-\mathrm{K})$ | $\begin{aligned} & =1545(\mathrm{ft}-\mathrm{lbf}) /(\mathrm{lbmol}- \\ & \left.{ }^{\circ} \mathrm{R}\right) \end{aligned}$ | Air | 28.97 |
|  |  | $=1.986 \mathrm{Btu} /\left(\mathrm{lbmol}-{ }^{\circ} \mathrm{R}\right)$ | $\mathrm{O}_{2}$ | 32.00 |
| Standard Acceleration of Gravity: $g$ | $=9.810 \mathrm{~m} / \mathrm{s}^{2}$ | $=32.174 \mathrm{ft} / \mathrm{s}^{2}$ | $\mathrm{N}_{2}$ | 28.01 |

|  |  | $=1.94$ slug/ft ${ }^{3}$ | $\mathrm{CO}_{2}$ | 44.01 |

a) A daisy with mass $m_{d}$ leaps off on an initially stationary anvil of mass $m_{a}$ (with remarkable, frictionless tank treads) with a relative velocity, $V_{d}$. What is the resulting velocity, $V_{a}$, of the anvil to the right after the daisy jumps off?

b) After the daisy jumps off, the anvil continues moving to the right with velocity $V_{a}$. For the anvil system shown below, what is the angular momentum of the anvil about point A?

c) A Twinkie of mass $m_{T}=55 \mathrm{~g}$ launched by a rock candy ballista with a horizontal velocity $V_{T}=3 \mathrm{~m} / \mathrm{s}$ is the first shot in the junk food assault on the vegetable kingdom. In defense, a leading unit of cruciferous vegetables launches a brussels sprout of mass $m_{b}=25 \mathrm{~g}$ to impact (and therefore intercept) the Twinkie. The brussels sprout travels upward at a velocity of $V_{b}=2 \mathrm{~m} / \mathrm{s}$ and at an angle of 60 degrees relative to the horizontal. After the impact, the brussels sprout is embedded in the Twinkie and the combined mass has a horizontal velocity $V_{T+b, x}=1.75 \mathrm{~m} / \mathrm{s}$ and a vertical velocity of $V_{T+b, y}=0.541 \mathrm{~m} / \mathrm{s}$, with the directions indicated in the figure below.

What is the impulse in the y-direction delivered to the Twinkie by the impact with the brussels sprout?
d) A pixie blows fairy dust (at location 1, pixie not shown, since invisible) through a piece of elbow macaroni to sprinkle the forest floor. The density of the fairy dust is $\rho_{d}$, moving at a velocity at the inlet of $V_{1}$, and the elbow is surrounded by atmospheric pressure. While the pixie is blowing, the pressure at 1 is $P_{1}$ and the pressure at $P_{2}$ is open to atmosphere. The macaroni areas are $A_{1}$ and $A_{2}$, respectively, and the relative angles of the macaroni openings are indicated on the figure below.

What is the net effect of pressure acting on the piece of elbow macaroni in the horizontal direction?

## Problem 2 ( 37 pts)

A flaming giraffe (of mass $m_{g}$ ), is riding a snowboard (mass $m_{s}$ ) and flying a kite (exerting a force $F_{k}$ at an angle $\alpha$ ) whilst being impacted by a stream of liquid clocks (entering horizontally and exiting at an angle $\beta$ ). Assume that the density of the clocks is $\rho_{c}$, the liquid clock inlet area is $A_{1}$, the inlet velocity is $V_{1}$, the exit area is $A_{2}$, the exit velocity is $V_{2}$.

a) Find the minimum coefficient of friction between the snowboard and the ground necessary to keep the giraffe (and snowboard) stationary.
b) What is the net rate of linear momentum transfer due only to the liquid clock mass flow?
$\square$

In a Salvador Dali painting, a silver dinner tray has grown legs and starts running with a bowling pin on top of the tray. The coefficients of static and kinetic friction between the pin and the tray/legs are $\mu_{s}=0.30$ and $\mu_{k}=0.22$, respectively. The dimensions and masses of the tray/legs and bowling pin are shown in the figure.
a) Find the maximum acceleration of the legs so that the bowling pin does not slip on the tray.
b) Find the maximum acceleration of the legs so that the bowling pin does not tip over.
c) Assume that the pin tips before it slips, and that the value of the acceleration at which tipping occurs is 2.1 $\mathrm{m} / \mathrm{s}^{2}$ (It isn't). For this acceleration,
i. find the value of the force the ground exerts on the foot, and
ii. find the value of the frictional force between the tray and the bowling pin.

Length
$1 \mathrm{ft}=12 \mathrm{in}=0.3048 \mathrm{~m}=1 / 3 \mathrm{yd}$
$1 \mathrm{~m}=100 \mathrm{~cm} \quad=1000 \mathrm{~mm}=39.37 \mathrm{in}=$
3.2808 ft

1 mile $=5280 \mathrm{ft}=1609.3 \mathrm{~m}$
Mass
$1 \mathrm{~kg}=1000 \mathrm{~g}=2.2046 \mathrm{lbm}$
$1 \mathrm{lbm}=16 \mathrm{oz}=0.45359 \mathrm{~kg}$
1 slug $=32.174 \mathrm{lbm}$

## Temperature Values

$(\mathrm{T} / \mathrm{K})=\left(\mathrm{T} /{ }^{\circ} \mathrm{R}\right) / 1.8$
$(\mathrm{T} / \mathrm{K})=\left(\mathrm{T} /{ }^{\circ} \mathrm{C}\right)+273.15$
$\left(\mathrm{T} /{ }^{\circ} \mathrm{C}\right)=\left[\left(\mathrm{T} /{ }^{\circ} \mathrm{F}\right)-32\right] / 1.8$
$\left(\mathrm{T} /{ }^{\circ} \mathrm{R}\right)=1.8(\mathrm{~T} / \mathrm{K})$
$\left(\mathrm{T} /{ }^{\circ} \mathrm{R}\right)=\left(\mathrm{T} /{ }^{\circ} \mathrm{F}\right)+459.67$
$\left(\mathrm{T} /{ }^{\circ} \mathrm{F}\right)=1.8\left(\mathrm{~T} /{ }^{\circ} \mathrm{C}\right)+32$

## Temperature Differences

$\left(\Delta \mathrm{T} /{ }^{\circ} \mathrm{R}\right)=1.8(\Delta \mathrm{~T} / \mathrm{K})$
$\left(\Delta T /{ }^{\circ} \mathrm{R}\right)=\left(\Delta \mathrm{T} /{ }^{\circ} \mathrm{F}\right)$
$(\Delta \mathrm{T} / \mathrm{K})=\left(\Delta \mathrm{T} /{ }^{\circ} \mathrm{C}\right)$

## Volume
