## Name

## ME301 - Applications of Thermodynamics

Circle section: 01 [10 am, Lui] 02 [11 am, Lui] 03 [10 am, Thom] 04 [11 am, Thom] 05 [11 am, Danesh]

Exam 2
Oct 27, 2022

## Rules:

- Closed book/notes exam.
- Help sheets allowed. (Two 8-1/2 $\times 11$ " sheet of paper, one side, handwritten; may not contain worked out example problems)
- Maple, Excel, and MATLAB are allowed on your laptop, but nothing may be prepared before the exam.
- Either open property tables (from your textbook) or open Property Calculator Programs on your laptop.

Instructions:

- Show all work for complete credit.
- Work in symbols first, plugging in numbers and performing calculations last.

## PROBLEM 2 [50 points]

A closed-system/ periodic cycle using water as its working fluid can be modeled as consisting of the following three steps:
(1) $\rightarrow$ (2) Constant-volume heat addition
(2) $\rightarrow$ (3) Constant-temperature expansion (3) $\rightarrow$ (1) Constant-pressure heat rejection

| State | $T\left[{ }^{\circ} \mathrm{C}\right]$ | $P$ [kPa] | $v\left[\mathrm{~m}^{3} / \mathrm{kg}\right]$ | $u[\mathrm{~kJ} / \mathrm{kg}$ ] | X |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | 80 |  |  | 0.40 |
| 2 |  |  |  |  |  |
| 3 |  |  |  |  | NA |

|  | $q_{\text {in }}[\mathrm{k} / \mathrm{kg}]$ | $W_{\text {in }}[\mathrm{kJ} / \mathrm{kg}$ ] |
| :---: | :---: | :---: |
| $1 \rightarrow 2$ | 450 |  |
| $2 \rightarrow 3$ |  | -1000 |
| $3 \rightarrow 1$ | Don't calculate |  |

(a) The $T$-s diagram for the cycle is shown. Draw the $P-v$ diagram relative to the two-phase dome with properly labeled isotherms.
(b) Find the unknown values of heat transfer per unit mass, $q_{A \rightarrow B}$, and the work per unit mass, $w_{A \rightarrow B}$ for each process in the cycle.
(c) Find the cycle efficiency.

## PROBLEM 2 [50 points]

A flow of $\dot{n}_{1}=2.0 \mathrm{kmol} / \mathrm{s}$ of a dry exhaust at $T_{1}=200^{\circ} \mathrm{C}$ and $P_{1}=100$ kPa mixes with a stream of pure nitrogen at $T_{2}=25^{\circ} \mathrm{C}$ and $P_{2}=100$ kPa in an adiabatic mixing chamber. The molar composition of the dry exhast is $60 \%$ nitrogen and $40 \%$ carbon dioxide. If the product stream exits the chamber at $T_{3}=50^{\circ} \mathrm{C}$ and $P_{3}=100 \mathrm{kPa}$,
 determine
(a) the molar flow rate of the coolant $\mathrm{N}_{2}$ stream, $\dot{n}_{2}$, in $\mathrm{kmol} / \mathrm{s}$ and
(b) the rate of entropy generation inside the mixing chamber, in $\mathrm{kW} / \mathrm{K}$.

Assume all gases behave as ideal gases with variable specific heats.
