

---

## Examples

1. A surface area of  $2 \text{ m}^2$  has a steady, uniform temperature of  $T_{s,out} = 13^\circ\text{C}$  and an emissivity of  $\varepsilon = 0.93$ . The temperature of the surroundings to which this surface radiates is  $268 \text{ K}$ . Find the net radiation heat transfer (in  $\text{W}$ ) from the surface to the surroundings.
2. Concurrently, air at  $10^\circ\text{C}$  blows over the surface. The resulting convective heat transfer coefficient is  $h = 20 \text{ W/m}^2\text{-K}$ . Find the convection heat transfer (in  $\text{W}$ ) from the surface to the air.
3. The surface is actually a makeshift roof of a clubhouse. The roof material is  $13 \text{ mm}$  thick, and the *inside* temperature is  $T_{s,in} = 25^\circ\text{C}$ . Assuming that heat transfer through the roof is one-dimensional and steady, find the thermal conductivity (in  $\text{W/m}\cdot\text{K}$ ) of the roof material.
